Bootstrap inference in the simulations, n = 2000, 500 replicates per setting

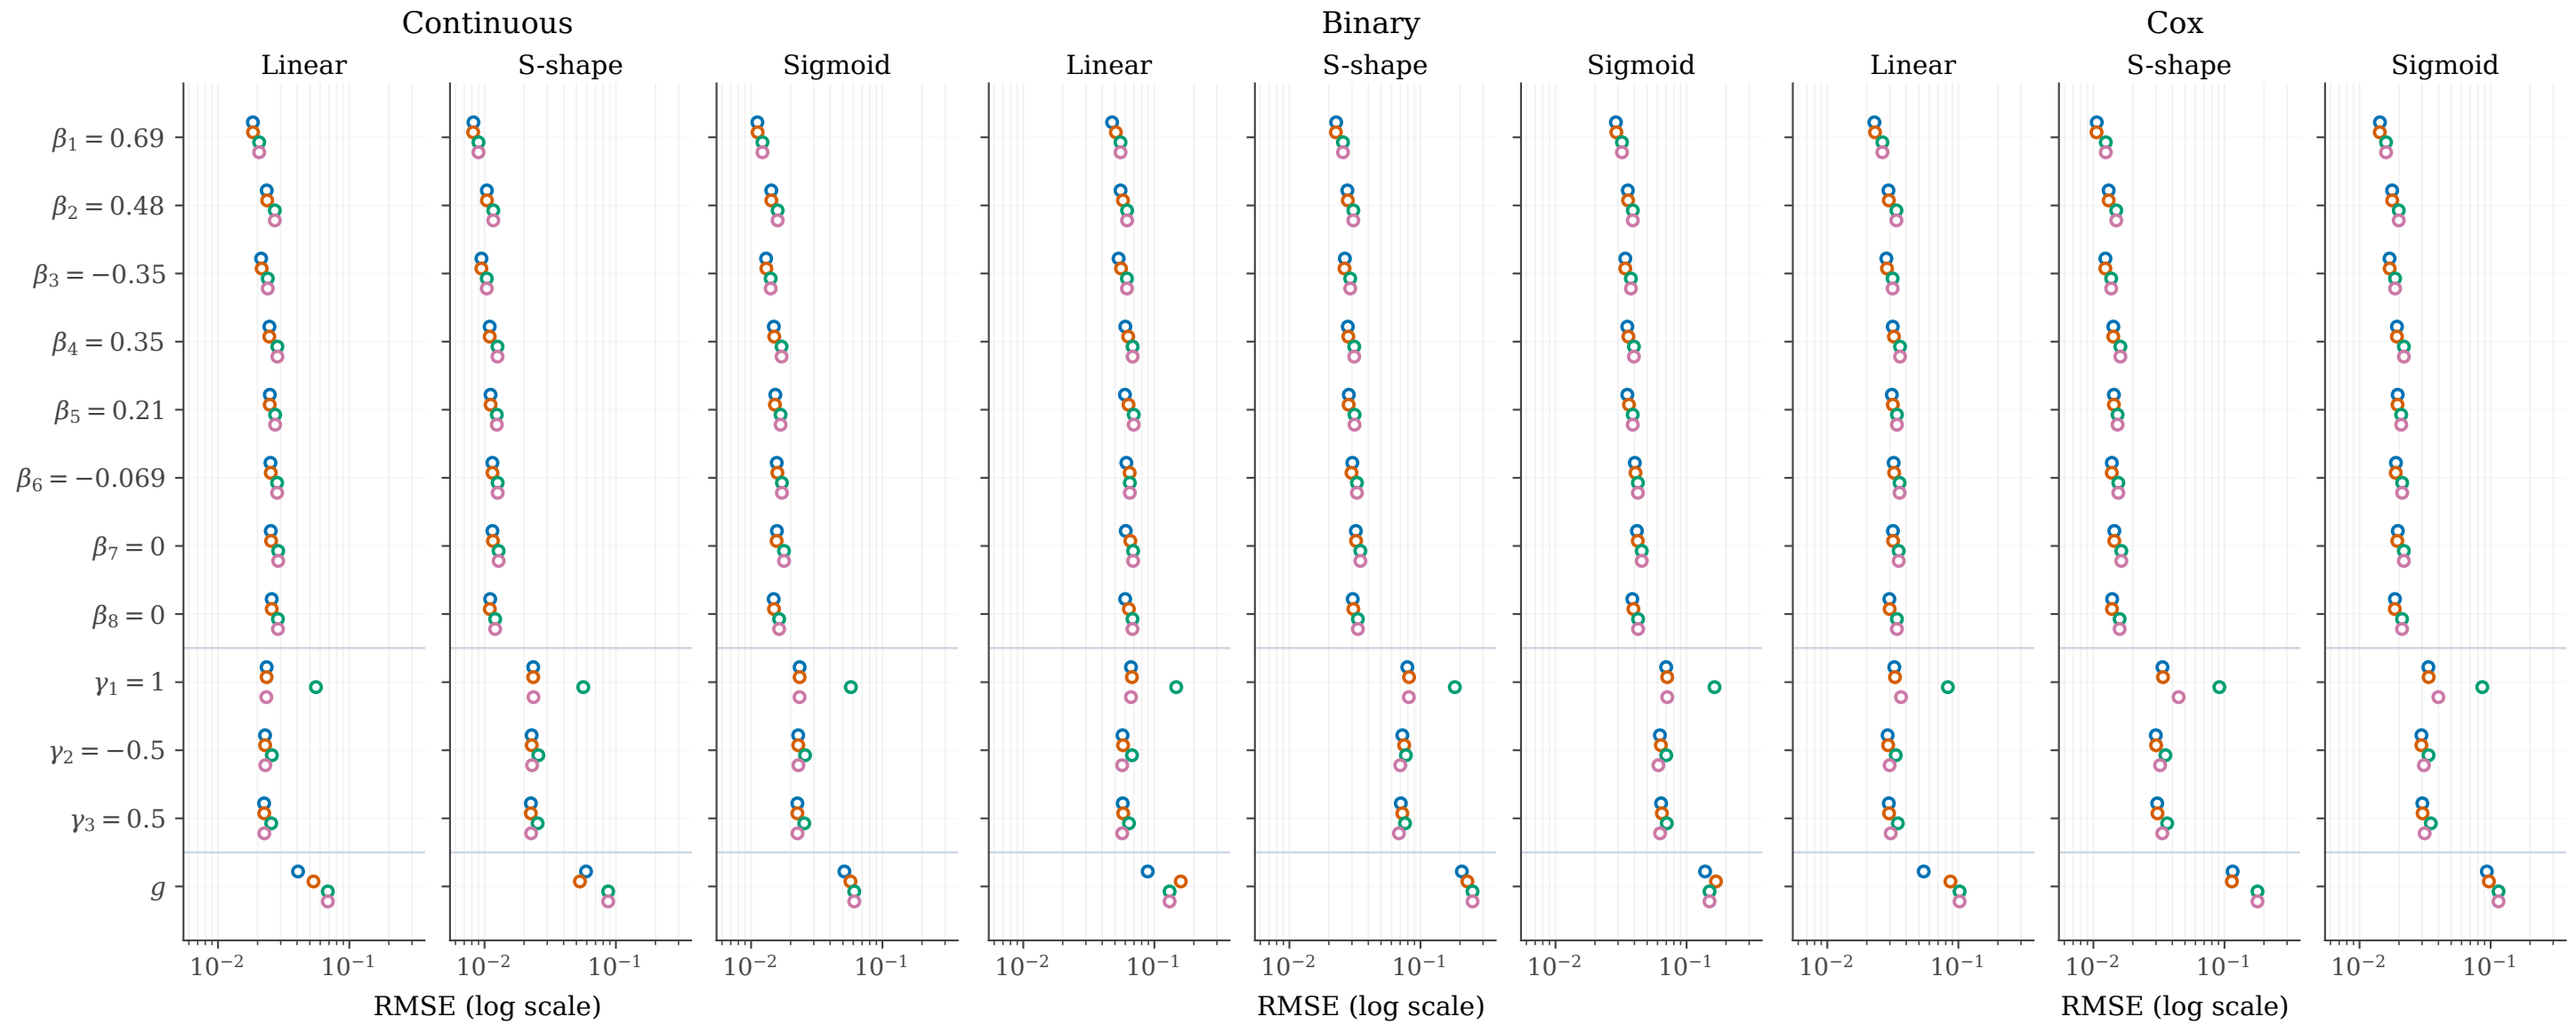

A Coverage of the 95% bootstrap CI for each coordinate of β and γ, with its 95% Monte-Carlo interval over the 500 replicates

B SE calibration for each coordinate: below 1.0 means the intervals are too narrow

C Estimation accuracy: RMSE of each coordinate, and of g over $|u| \leq 2$

D Pointwise coverage of the 95% bootstrap band for g(u)
